FASHION CHANGER FOR MEN: COLOR TELEVISION

By WAYNE OLIVAR

THE SAN DIEGO UNION
Jan. 6, 1964

WHEN the color television picture tube is finally perfected, it will change the face of television as much as the phonograph did to music or radio did to sound on the airwaves.

There will be color television sets when the present vacuum tube is replaced by a gas tube. The gas tube, which is already in use in the laboratory, has a tube containing an atmosphere of gas, as opposed to the vacuum of the present tube. This gas tube is more durable and can be made smaller than the vacuum tube.

The color television picture tube will be made of two tubes. The first tube will be a black and white tube, and the second tube will be a color tube. The color tube will be made of a gas tube, and the black and white tube will be made of a vacuum tube.

The color television picture tube will be made of a gas tube, and the black and white tube will be made of a vacuum tube.

The color television picture tube will be made of a gas tube, and the black and white tube will be made of a vacuum tube.
